

Microsoft Teams Recording Automation

The HR and Marketing teams host recurring **Knowledge Exchange sessions** in Microsoft Teams. To allow invited employees and external presenters to participate in the meeting chat without becoming members of the Corporate Communications Team, sessions are scheduled as **regular Teams meetings**. Recordings are automatically saved to the organizer's **OneDrive Recordings folder**, where Power Automate identifies Knowledge Exchange recordings and archives them into organized **SharePoint folders based on the meeting date and company name**.

Created a Team named '**Corporate Communications**' with a '**Knowledge Exchange**' channel as the internal collaboration for HR and Marketing.

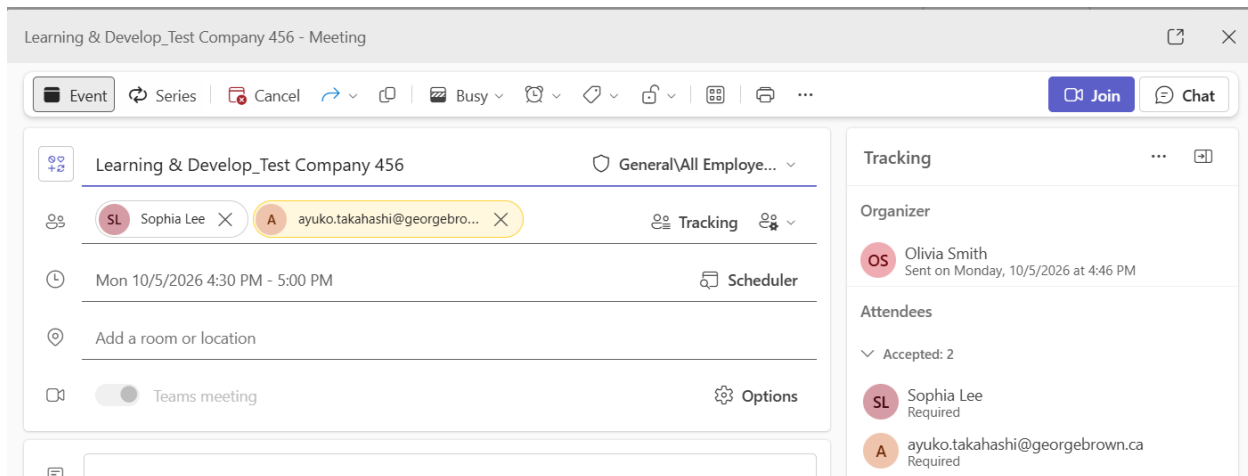

Note: Difference between MS365 Groups and Teams to create

Add a team

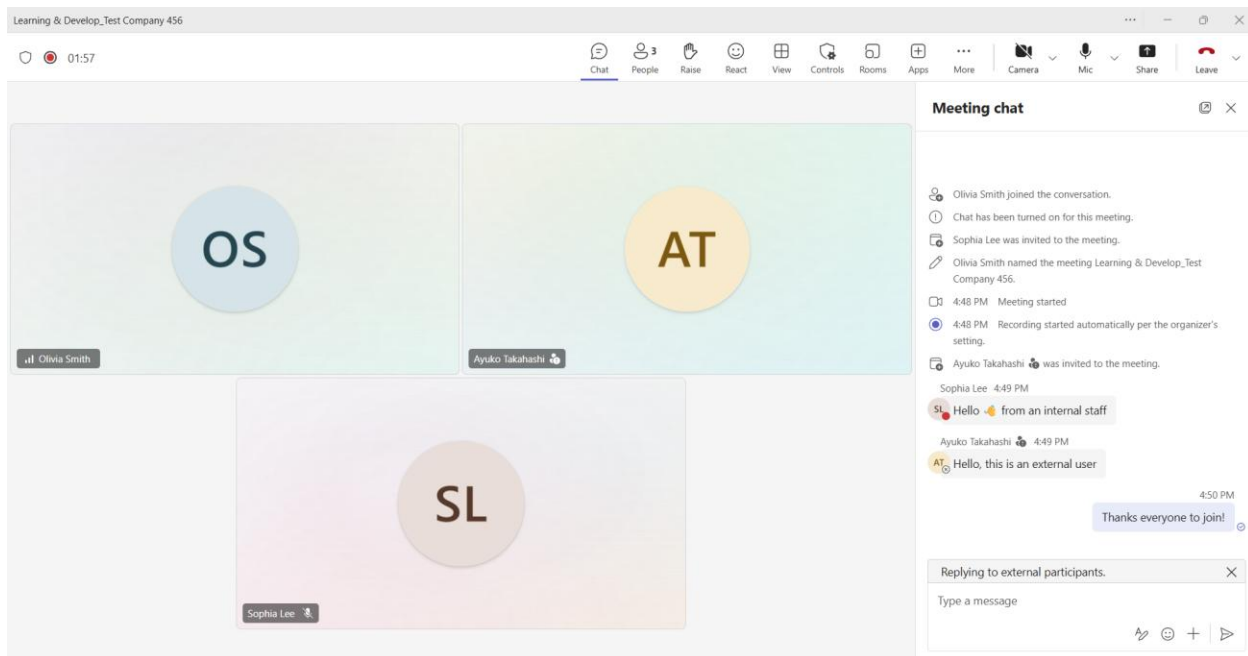

- Creates the Team
- Creates the underlying **Microsoft 365 Group**
- Creates the associated **SharePoint team site**
- Gives us channels where we can schedule the test meeting.

Add a Microsoft 365 group

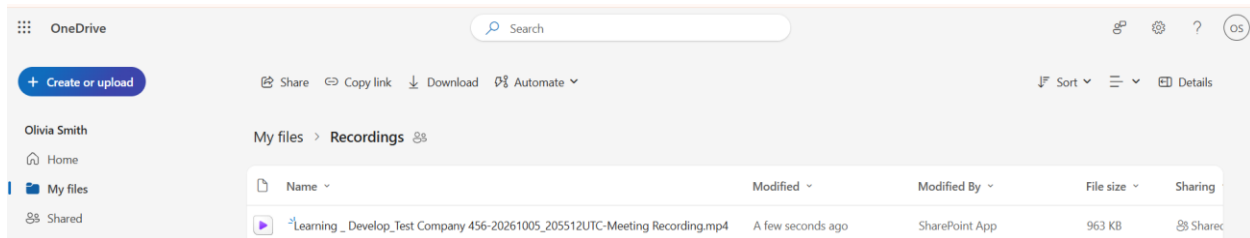

- Creates the M365 Group
- Creates its SharePoint site and other group resources
- **Doesn't necessarily create/enable the Team experience**

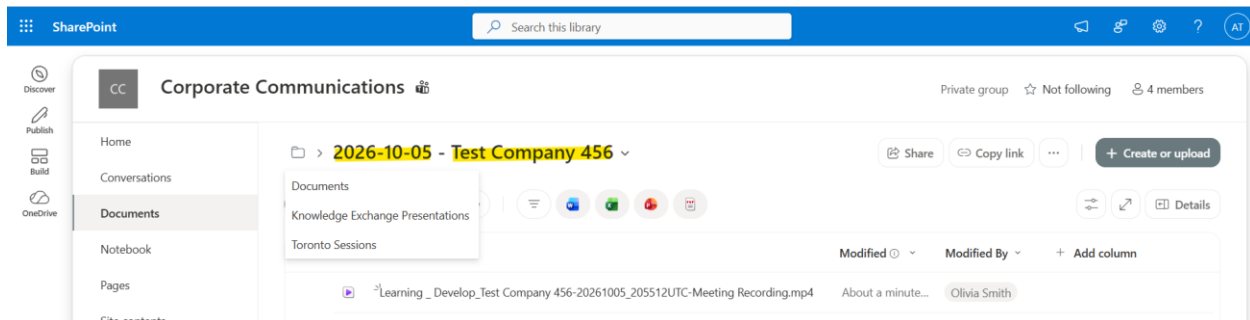

Knowledge Exchange sessions are scheduled as **regular Teams meetings** by Olivia Smith so invited employees and external presenters can access the meeting chat.

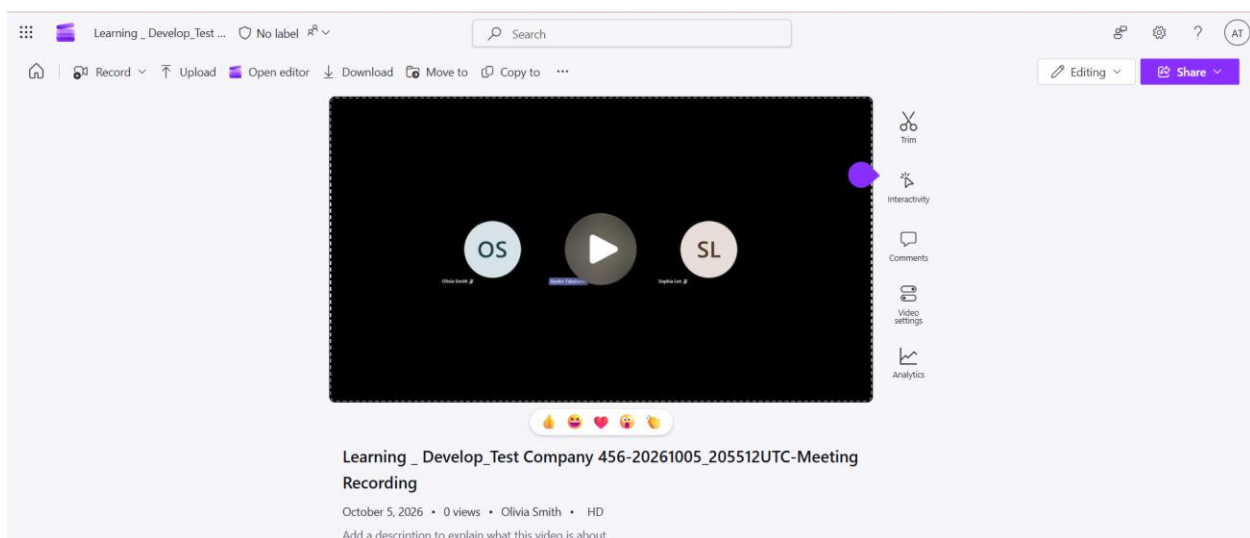

Verified that invited **internal employees and external presenters can participate in the meeting chat** without being added as members of the Corporate Communications Team.

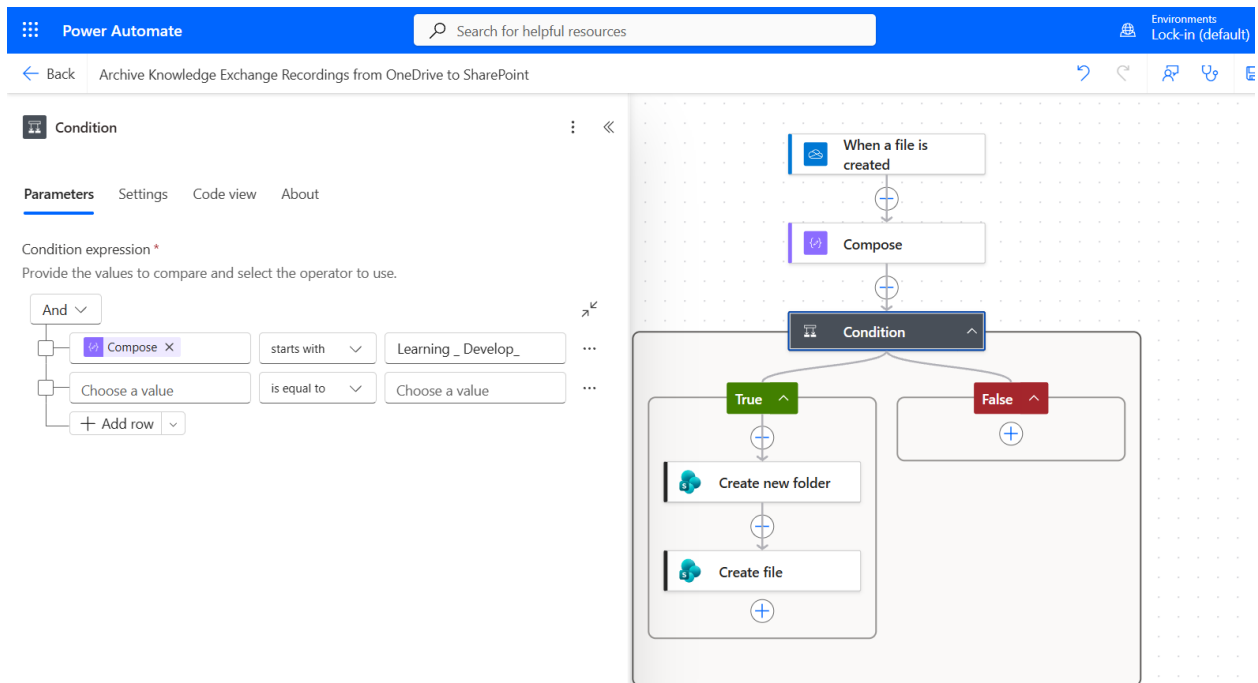

Recordings from regular Teams meetings are automatically saved to the meeting organizer's (Oliver Smith) **OneDrive Recordings** folder. This folder is monitored by Power Automate to identify Knowledge Exchange recordings for archival.

Power Automate automatically creates a folder using the **meeting date and company name** and copies the Knowledge Exchange recording from the organizer's OneDrive to the **Corporate Communications SharePoint** archive.

After the recording is archived from its original OneDrive location to SharePoint, the original Teams recording expiration no longer applies. The archived recording can therefore be retained according to the organization's storage and retention requirements.

Power Automate monitors the organizer's **OneDrive Recordings** folder, decodes the filename, and filters for Knowledge Exchange recordings. When a recording matches the naming convention, the flow automatically creates a SharePoint folder based on the **meeting date and company name** and copies the recording into the archive. Unrelated recordings are ignored.

Future Improvement:

Once the archival workflow has been fully tested and proven reliable, a **Delete file** action can be added after successful SharePoint archival to remove the original recording from the organizer's OneDrive and avoid duplicate storage.

SharePoint still has plenty of unused storage capacity, so moving the recordings to Azure Blob Storage wouldn't necessarily save money at this stage, since the SharePoint capacity is already included in the Microsoft 365 licensing. I'm also planning to analyze recording views to determine whether all recordings actually need to be archived long term. If storage usage grows significantly, Azure Blob Storage would definitely be worth considering.
