

Microsoft Teams Recording Automation

The HR and Marketing teams host recurring **Knowledge Exchange sessions** in Microsoft Teams. Meeting recordings are automatically saved to the channel's SharePoint **Recordings** folder. To reduce manual file management and maintain an organized archive, Power Automate automatically creates a folder based on the **meeting date and company name** and moves each recording to the appropriate folder under **Knowledge Exchange Presentations**.

Created a Team named '**Corporate Communications**' and a channel named '**Knowledge Exchange**' to host the learning sessions.

Note: Difference between MS365 Groups and Teams to create

Add a team

- Creates the Team
- Creates the underlying **Microsoft 365 Group**
- Creates the associated **SharePoint team site**
- Gives us channels where we can schedule the test meeting.

Add a Microsoft 365 group

- Creates the M365 Group
- Creates its SharePoint site and other group resources
- **Doesn't necessarily create/enable the Team experience**

Teams meeting recordings are initially saved automatically to the channel's SharePoint Recordings folder.

Power Automate detects a new recording, dynamically creates an archive folder, and moves the recording.

Recordings are automatically organized by meeting date and company name based on the meeting title.

Note: According to Microsoft Learn, once a meeting recording is moved from its original location, the expiration setting no longer affects it. The expiration date may still be displayed on the video and can be changed manually.

Recording and transcription lifecycle

By default, meeting recordings and transcripts are deleted after 120 days. The following policies in the Teams admin center manage the recording lifecycle:

- **Recordings automatically expire** determines if meeting recordings and transcripts are automatically deleted after a specified time.
- **Default expiration time** specifies the number of days after which recordings and transcripts are deleted. The default is 120.

When a meeting participant records a meeting, the recording is stored in the organizer's OneDrive. Channel meetings are stored in the SharePoint site associated with the channel. Because meeting recordings are .mp4 files, they can be moved or deleted like any other file. If a meeting recording is moved from its original location, the expiration setting no longer affects it. For details, see [Teams meeting recording storage and permissions in OneDrive and SharePoint](#).

The expiration feature removes old recordings and transcripts to save storage space, but doesn't enforce compliance requirements. If you have meeting recording retention and deletion compliance requirements, consider storing them in a SharePoint library where you can apply [Microsoft Purview retention policies](#).
